

Dispute & Chargeback Management Agent

High-Level Narrative

What this application does

This application is a dispute-operations simulation and decision-support environment for chargeback management. It helps teams detect early risk, coordinate evidence, run policy-aware workflows, and close disputes with clear accountability across customer, merchant, and admin roles.

Core capabilities

1) End-to-end lifecycle visibility from intake through closure. 2) Early signal detection and urgency scoring. 3) Policy-aware guidance including on-trip urgency and enforcement context. 4) Evidence-centric case handling with sample documentation. 5) Money movement and closure acceptance logic.

Why it matters

Dispute operations often fail due to fragmented data and inconsistent response quality. This workspace centralizes communication, evidence, policy guidance, and financial context so teams can reduce avoidable escalation and improve closure speed.

Three-party operating model

The system aligns customer, merchant, and platform-admin decisions in one workflow so each case has a shared timeline, traceable actions, and policy-consistent next steps.

Current communication flow

Case Level Communication supports Send Money, Receive Money, and Send Message actions. Submitting an action moves the case to Request Closure. When the counterparty accepts closure, the case automatically transitions to Closed.

Merchant benefits

Merchants get faster closure paths, clearer payout and exposure visibility, stronger evidence discipline, and earlier policy-aligned guidance to reduce avoidable escalation.

Customer benefits

Customers get clearer lifecycle visibility, more predictable next steps, and faster communication-to-resolution outcomes with explicit closure acceptance flow.

Calculable financial metrics

Disputed amount at risk, win/loss value, net recovery, average settlement amount, fee burden, and estimated escalation cost avoided.

Calculable non-financial metrics

Time to first response, time to close, closure acceptance rate, escalation rate, evidence completeness rate, policy compliance rate, and repeat-dispute incidence.

Practical value

This project helps payments, risk, and product teams pressure-test workflows before production rollout, standardize dispute playbooks, and improve evidence quality for negotiation or representment.
